MADE IN BELGIUM

DYNAMIC LOAD TRANSFER CHALLENGE

Viscious circle of damage and discomfort caused by wheel impact

HCJ solved the problem with its Sinus Slide® joint

Perfection was achieved with Cosinus Slide® joint and its double slide effect

THE MARKET INNOVATORS

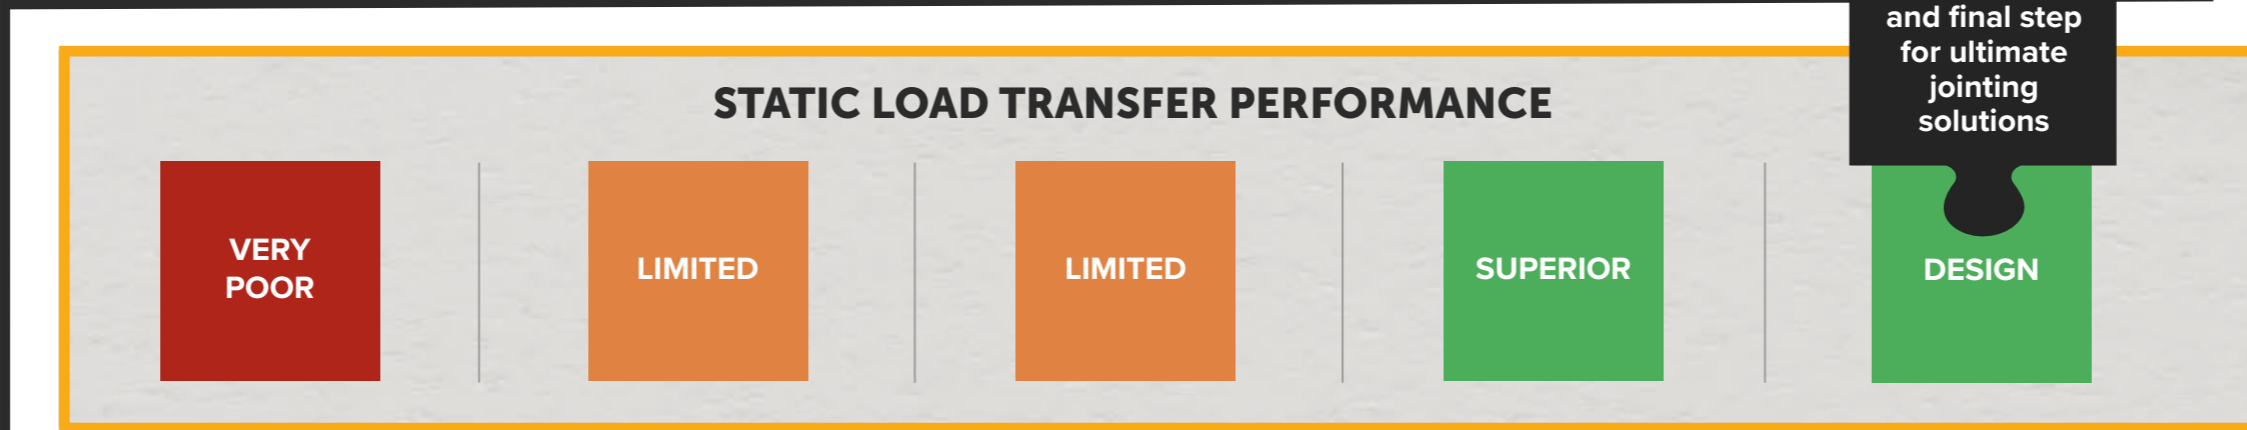

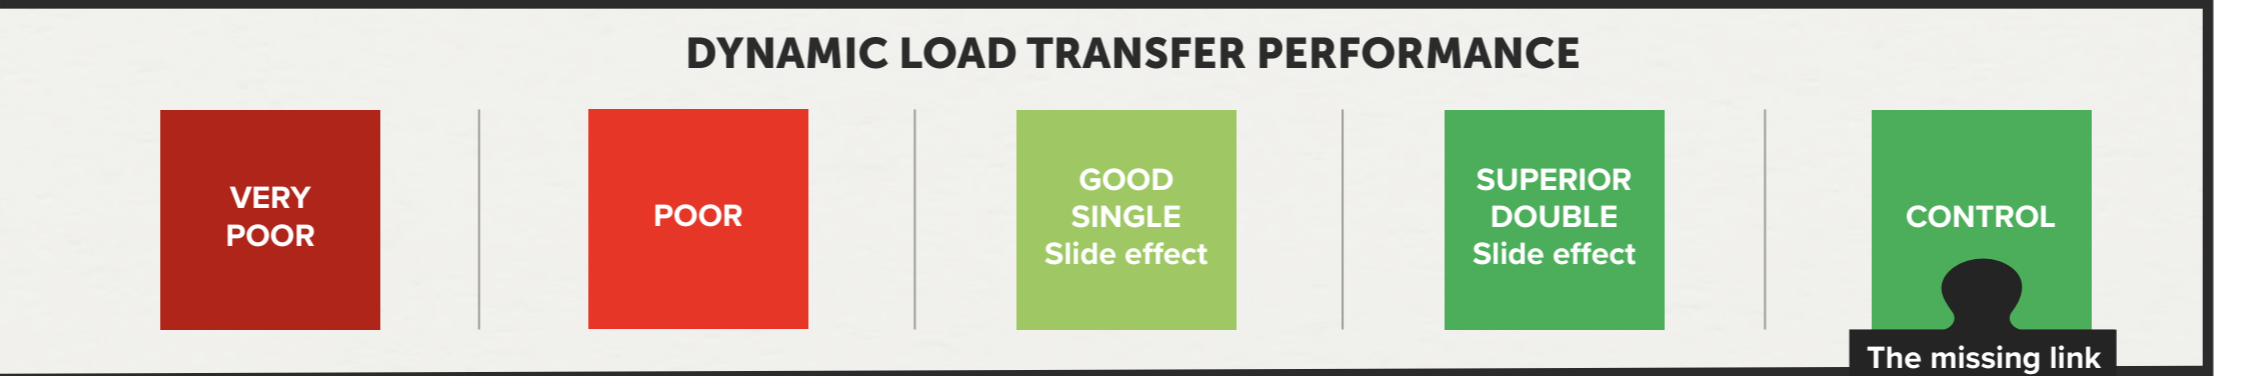

STATIC LOAD TRANSFER CHALLENGE

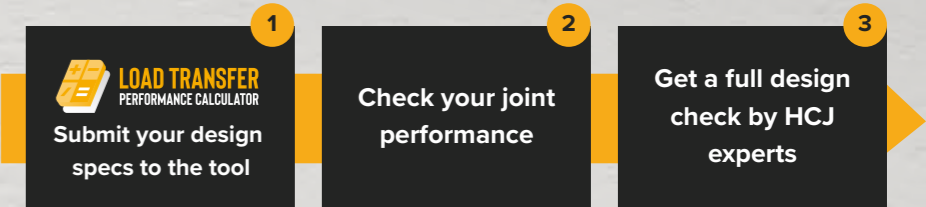

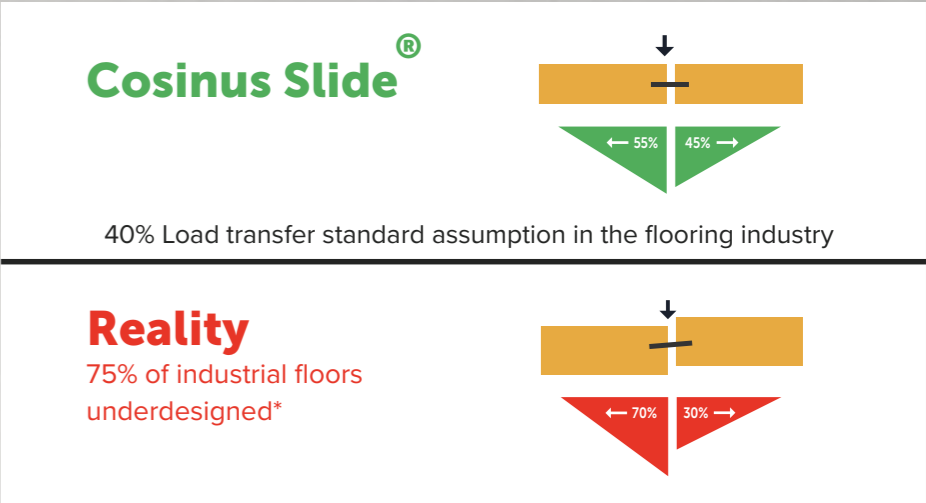

HIGHER RACKS + CLOSER TOGETHER = HIGHER LOADS

Is your joint up to the challenge?

*We estimate that 75% of all installed joints are unable to meet the minimum requirement of a 40+% load transfer. Most jointing solutions cannot deliver more than a 30% load transfer, which is simply not enough for today's requirements. This means that the vast majority of floors today are underdesigned and expected to trigger repair, floor deformations, warehouse floor down-time and personnel absenteeism.

Make sure you select the right joint with our services

With the introduction of the load transfer performance calculator HCJ enables any flooring professional to accurately select the right joints.
